

The Right Drug for the Right Person at the Right Time

People vary in their response to medication. Not all drugs work optimally for everyone because of how genes and medications interact.

If you are enrolled in the Genomic Life benefit and have any of the following conditions, a genetic test called Pharmacogenomics (PGx) test can tell you how you metabolize it, revealing whether it's effective for you.

- Mental health conditions
- Bleeding or clotting disorders
- High cholesterol
- Stomach acid
- Pain
- Taking five or more medications

This simple, genetic test helps you

- Improve care
- Decrease side effects
- Inform personalized prescribing
- Reduce adverse reactions¹
- Reduce trial and error
- Save money²

The results of your PGx test will empower you to know what drugs work and don't work for you.

With this information, you and your doctor can tailor medication to your genes, increasing the overall effectiveness of medications.
